

Find the item id with max price in **sales.csv**

Okay, I'm **99% sure** I should just read the csv and extract "price". If I'm wrong, I'll have to fix my mistake.

Guess-and-Go ↩

```
df = pd.read_csv("sales.csv")
df["price"].max()
```

PASS

Find the item id with max price in **sales_fr.tsv**

This might not be standard; I'm only **50% confident** I know what to do.

Deliberate Testing ↩

column names?

INFO: ...

> head -n 50

INFO: ...

```
df = pd.read_csv("sales_fr.tsv",
                  sep="\t")
df["prix"].max()
```

PASS

WHAT THE AGENT DOES NOT KNOW

Every file has a hidden format with three parts:

delimiter

, ; \t

quote character

" '

header rows to skip

0 1

Twelve combinations, and the file only parses if all three are right. The filename is the only clue:

`sales_fr.tsv` points to a tab.
